hi

Hello! How can I assist you today? Whether it's providing information on various topics or helping with tasks, feel free to ask and I'll do my best to help.

what is AI?

Artificial Intelligence (AI) refers to the simulation of human intelligence processes by machines, particularly computer systems. These processes include learning (the acquisition of information and rules for using the information), reasoning (using the rules to reach approximate or definite conclusions), and self-correction. AI enables computers and other electronic systems to mimic cognitive functions that humans associate with other living beings.

Today, AI can be used in many ways, such as pattern recognition, speech recognition, decision making, learning from experience, knowledge-based systems, etc. It can recognize objects and voices, play games at a professional level, recommend products or services based on your preferences, and much more. As technology advances, the capabilities of AI continue to expand.

Alibaba Cloud offers various AI solutions, including voice assistants, image recognition, natural language processing (NLP), recommendation systems, and computer vision. These solutions can be integrated into applications to provide intelligent experiences that improve functionality, convenience, efficiency, and user experience for your customers or users.

500-200+900/890 give answer for this

Status Code: 200

Raw Response:

```
{"model": "qwen2.5:3b", "created_at": "2026-07-03T11:13:44.1896392Z", "response":
```

To solve the expression $500 - 200 + 900 / 890$:

First, you need to perform the division operation: $[900 \div 890 = 1.011235955]$ (rounded to several decimal places)

Then add and subtract from left to right: $[500 - 200 + 1.011235955 = 300 + 1.011235955 = 301.011235955]$

So the final answer is approximately: $[301.011]$ (rounded to three decimal places)
